LKS is a rare neurological disorder that affects children. It is characterized by seizures, language delays, and behavioral problems. LKS is often misdiagnosed as autism or other developmental disorders.

The exact cause of LKS is unknown, but it is thought to be caused by a combination of genetic and environmental factors. LKS is often associated with other medical conditions, such as epilepsy, autism, and cerebral palsy.

LKS typically begins between the ages of 2 and 4. The first symptoms are often seizures. The seizures can be generalized, which means they affect

Children with LKS may also exhibit behavioral problems. These problems can include aggression, hyperactivity, and impulsivity.
